Digital Contract System – Build Scope & Implementation Steps

Objective

Design and implement an AWP-owned digital contract system that captures clean, structured sales data at the point of sale and synchronizes that data into HubSpot.

Phase 0.1 – Digital Contract System

- **System Design & Ownership**
Build a mobile-optimized, web-based digital contract platform. Ensure AWP retains ownership and control of all contract data. Structure all contract data for long-term internal system interoperability.
- **Digital Contract Data Capture**
Capture customer information, product selections, pricing details, configurable options, and contract terms in a structured, standardized format suitable for automation and reporting.
- **Electronic Signature & Document Storage**
Implement electronic signature functionality and store completed contracts in a centralized digital repository with secure internal access.
- **HubSpot Synchronization**
Automatically sync structured contract data into HubSpot, including contact records, deal records, contract attachments, and relevant custom fields to establish a clean foundational data layer.

Phase 0.2 – Commission Automation & Data Interoperability

- **Commission Calculation Logic**
Embed commission logic directly into the digital contract system with support for multiple compensation models and automated calculations tied to contract data.
- **Structured Commission Outputs**
Generate reliable, structured commission outputs aligned with contract data and formatted for use by finance, reporting, and other internal business systems.

Data Integrity & Interoperability Goals

- Establish data ownership at the moment of sale
- Eliminate downstream re-entry of contract data
- Remove ambiguity in compensation and contract records
- Create a scalable data foundation for future system integrations

Implementation Process

Development may proceed iteratively. Client feedback will be incorporated during implementation provided it remains aligned with the defined Phase 0 objectives and scope.
